

NICKOLIS KACLUDIS

Software Engineer | Baseball Analytics | U.S. Army Veteran

Noblesville, IN • (623) 693-0189 • nickoliskacludis@gmail.com • linkedin.com/in/nickolis-kacludis • github.com/Nickolisk24

SUMMARY

Software engineer and U.S. Army veteran with an A.A.S. in Computer Systems & Applications, specializing in full-stack analytics platforms, data pipelines, recommendation systems, and simulation engines. Built BaseballOS, a bullpen intelligence platform with workload modeling, availability classification, explainable recommendations, and trust/freshness governance; and The Forge, a large-scale extraction and simulation platform with normalized data pipelines and stat/combat/crafting engines.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL, HTML/CSS, Java, C++, C#

Backend: Flask, FastAPI, Node.js, REST APIs, SQLAlchemy, Alembic

Frontend: React, TypeScript, TailwindCSS, Vite, responsive UI

Data & Infra: PostgreSQL, Redis, Git/GitHub, GitHub Actions, pytest, Vercel, Neon

Engineering: Data pipelines, recommendation systems, simulation engines, explainability, CI/CD, trust & governance

TECHNICAL PROJECTS

BaseballOS — Bullpen Intelligence & Decision Support

Personal Project | github.com/Nickolisk24

Python · Flask · PostgreSQL · React · TypeScript · TailwindCSS · MLB Stats API

- Architected a full-stack bullpen intelligence platform that turns MLB Stats API data into **workload modeling, availability classification, and recommendation workflows** for pitching decisions.
- Designed fatigue and availability engines using pitch counts, back-to-back appearances, rest windows, and recent usage trends to produce transparent pitcher-readiness tiers.
- Built deterministic recommendation infrastructure with eligibility gates, explainable outputs, freshness validation, confidence flags, and fail-closed safeguards for stale or incomplete data.
- Developed ingestion/sync pipelines and a relational PostgreSQL backend (players, teams, games, game_pitchers, pitcher_appearances) with Alembic migrations and audit-friendly data flow.

The Forge — Last Epoch Simulation & Data Platform

Personal Project | github.com/Nickolisk24

FastAPI · PostgreSQL · React · TypeScript · Redis · Alembic · pytest

- Designed and built a **patch-resilient game data pipeline** that extracts XML/JSON/binary source files into normalized PostgreSQL tables for passives, skills, items, affixes, uniques, blessings, ailments, timelines, and combat systems.
- Architected six stateless calculation engines (**stat, combat, defense, craft, simulation, passive**) behind FastAPI contracts and a typed React/TypeScript client.
- Implemented passive-tree and skill-system logic supporting 500+ nodes, namespaced IDs, dependency validation, mastery restrictions, path constraints, and real-time stat aggregation.
- Built Monte Carlo crafting simulations, fracture-risk math, optimal-path search, three-strategy comparison tooling, and SVG-based passive-tree visualization.
- Improved reliability through re-runnable sync jobs, automated validation, pytest coverage, rate limiting for CPU-intensive endpoints, and refactors from a professional code review.

PROFESSIONAL EXPERIENCE

Coca-Cola Consolidated — Merchandiser

Indiana | 2025 – Present

- Manage inventory execution, product flow, and merchandising standards across a multi-store route while meeting strict daily deadlines.
- Coordinate with store managers and delivery teams to resolve stocking issues and maintain brand-compliant displays.

Walmart — Overnight Stocking Associate

December 2021 – April 2025

- Trained and onboarded new associates on stocking standards, safety expectations, and nightly throughput goals.
- Maintained inventory accuracy, built endcap displays, and supported planogram resets in a high-volume retail environment.
- Partnered with team leads to prioritize tasks and streamline workflow during high-volume overnight shifts.

U.S. Army — Heavy Wheeled Truck Driver (88M)

May 2014 – August 2021

- Coordinated mission-critical logistics and transportation operations under tight timelines and operational constraints.
- Maintained full accountability for vehicles, equipment, and small arms with zero discrepancies across multiple inspections.
- Kept detailed maintenance and compliance logs aligned with safety, regulatory, and readiness standards.
- Trained and mentored junior soldiers in maintenance procedures and operational discipline, strengthening team performance.

Custom PC Builder / Hardware Technician

January 2018 – Present

- Build and configure custom desktops; diagnose hardware/software issues and select compatible components for performance targets.
- Install and optimize operating systems and software for reliable, efficient end-user systems.

EDUCATION

Yavapai College — Prescott, AZ

August 2022 – May 2024

Associate of Applied Science, Computer Systems & Applications

ADDITIONAL

- **Veteran:** 8 years U.S. Army (88M, Heavy Wheeled Truck Driver). Honorable service 2014–2021.
- Currently building and maintaining BaseballOS and The Forge, two full-stack analytics platforms focused on data pipelines, recommendation systems, simulation engines, explainability, and trust-first software design.
